## Canada's National Highway System An Ovenview

April 2008

## Introduction

Canada’s National Highway System (NHS) was established in 1988 by the Council of Ministers Responsible for Transportation and Highway Safety. The 24,500 kilometre network of key interprovincial and international highway linkages was identified through a federal-provincialterritorial cooperative study carried out over the period 1988 to 1992.

In September 2004 the Council of Ministers approved the addition of 2700 kilometres of new routes to the NHS, as a result of a study undertaken by Transport Canada. In September 2005, following a comprehensive review of the NHS by a federal, provincial and territorial Task Force, further expansion of the system to include an additional 8800 km of routes was endorsed by the Council of Ministers.

Canada’s National Highway System now encompasses over 38,000 kilometres of key highway linkages. It is vital to both the economy and to the mobility of Canadians, and while it represents only $3 \%$ of the road network, it carries over $37 \%$ of the annual travel by road.

## Core Routes

- Key interprovincial and international corridor routes (including links to intermodal facilities and important border crossings)

## Feeder Routes

- Key linkages to the Core Routes from population and economic centres (including links to intermodal facilities and important border crossings)

## Northern and Remote Routes

- Key linkages to Core and Feeder routes that provide the primary means of access to northern and remote areas, economic activities and resources.

The information contained in the report which follows offers insight to the role played by the National Highway System, its performance, the state of its infrastructure and the investment being made in its restoration and improvement.

This is the first report on the condition of the NHS in its current configuration.
The report was assembled using statistical information provided by the provincial and territorial departments of transportation, and while effort was taken to ensure completeness and consistency, it should be noted that:

- data for federal and municipal roads on the NHS was not readily available, and except where explicitly noted, is not included in the summaries
- there are several important limitations and cautions on the use of the information as outlined in the Endnotes.

## Source: Statistics Canada, Transport Canada (Tourism)

Note (1): Includes crossings on both NHS Core and Feeder routes
Note (2): Two-way traffic data are estimated by doubling northbound traffic flows.
Note (3): Imports (i.e. inbound trade) are assigned to the port of clearance, which in some cases may be an inland location and not the land crossing that was used to enter the country. The value of imports passing through NHS crossings is therefore underestimated.
Note (4): Value of tourism spending has been estimated by applying average spending and trip duration information to car traffic.

## Endnotes

1 Data provided for Québec includes collisions of all degrees of severity, including those only involving property damage.
2. Fatality figures reported by Manitoba are the number of fatal collisions; the actual number of fatalities associated with these collisions is not available.
3. Pavement condition rating information provided by jurisdictions is not based on identical criteria and thresholds; variations exist in the factors considered and approaches used to classify pavements as good, fair or poor.
4. Pavement condition information reported by British Columbia does not include information for roads under federal and municipal jurisdiction (~ 960 km ).
5. Pavement condition information reported by Alberta does not include complete information for roads under federal and municipal jurisdiction ( $\sim 250 \mathrm{~km}$ ).

6 Saskatchewan normally uses only two pavement condition rating categories; "Good" and "Poor".
7. Manitoba provided pavement condition information by 2-lane equivalent kilometers (rather than by section length). The figures presented in the tables were calculated by pro-rating survey data to reflect the percentage of the system that is divided. Manitoba's portion of the NHS includes 663.8 km of divided highways.
8. The data provided on the condition of roadways in Québec is based on information available for $4,650 \mathrm{~km}$ of routes (or approximately $1,000 \mathrm{~km}$ less than the full NHS network).
9. Transports Québec does not normally use the categories of "Good", "Fair" and "Poor" in depicting the condition of pavements. The thresholds used to differentiate "Good" from "Fair" are not used in Quebec, and the thresholds to differentiate "Fair" from "Poor" are based on thresholds for intervention, which vary from one class of road to another.
10. Information presented on the number and age of bridges does not include complete information for bridges on NHS roads under federal or municipal jurisdiction.

11 Québec is in the process of changing its system to include culverts from 3.0 to 4.5 m in diameter in its structures inventory. As this process is not yet complete, the data provided does not yet include all culverts over 3.0 m in diameter.
12. Total travel information statistics (vehicle-km) are understated, as complete data was not available for roads under federal and municipal jurisdiction.
13. For Québec, the kilometers of truck travel provided are estimates based on the percentage of trucks in the traffic stream. While this approach is commonly used, the accuracy can be quite variable.
14. The assumptions used in preparing the investment figures presented may not be completely consistent between jurisdictions. The data provided by Québec includes only the direct costs of work projects; related and indirect expenses are not included.
15. The reported investments of the federal government are for federal contributions to Québec projects.
